致读者

Netkiller 系列手札 已经被 Github 收录，并备份保存在北极地下 250 米深的代码库中，备份会保留 1000 年。

Preserving open source software for future generations

The world is powered by open source software. It is a hidden cornerstone of modern civilization, and the shared heritage of all humanity.

The GitHub Arctic Code Vault is a data repository preserved in the Arctic World Archive (AWA), a very-long-term archival facility 250 meters deep in the permafrost of an Arctic mountain.

We are collaborating with the Bodleian Library in Oxford, the Bibliotheca Alexandrina in Egypt, and Stanford Libraries in California to store copies of 17,000 of GitHub's most popular and most-depended-upon projects—open source's “greatest hits”—in their archives, in museum-quality cases, to preserve them for future generations.

<https://archiveprogram.github.com/arctic-vault/>

自述

《Netkiller 系列 手札》是一套免费系列电子书，netkiller 是 nickname 从1999 开使用至今，“手札”是札记，手册的含义。

2003年之前我还是以文章形式在BBS上发表各类技术文章，后来发现文章不够系统，便尝试写长篇技术文章加上章节目录等等。随着内容增加，不断修订，开始发布第一版，第二版.....

IT知识变化非常快，而且具有时效性，这样发布非常混乱，经常有读者发现第一版例子已经过时，但他不知道我已经发布第二版。

我便有一种想法，始终维护一个文档，不断更新，使他保持较新的版本不过时。

第一部电子书是《PostgreSQL 实用实例参考》开始我使用 Microsoft Office Word 慢慢随着文档尺寸增加 word 开始表现出力不从心。

我看到PostgreSQL 中文手册使用SGML编写文档，便开始学习 Docbook SGML。使用Docbook写的第一部电子书是《Netkiller Postfix Integrated Solution》这是Netkiller 系列手札的原型。

至于“手札”一词的来历，是因为我爱好摄影，经常去一个台湾摄影网站，名字就叫“摄影家手札”。

由于硬盘损坏数据丢失 《Netkiller Postfix Integrated Solution》的 SGML文件已经不存在；Docbook SGML存在很多缺陷 UTF-8支持不好，转而使用Docbook XML。

目前技术书籍的价格一路飙升，动则¥80，¥100，少则¥50，¥60。技术书籍有时效性，随着技术的革新或淘汰，大批书籍成为废纸垃圾。并且这些书技术内容雷同，相互抄袭，质量越来越差，甚至里面给出的例子错误百出，只能购买影印版，或者翻译的版本。

在这种背景下我便萌生了自己写书的想法，资料主要来源是我的笔记与例子。我并不想出版，只为分享，所以我制作了基于CC License 发行的系列电子书。

本书注重例子，少理论（捞干货），只要你对着例子一步一步操作，就会成功，会让你有成就感并能坚持学下去，因为很多人遇到障碍就会放弃，其实我就是这种人，只要让他看到希望，就能坚持下去。

1. 写给读者

为什么写这篇文章

有很多想法,工作中也用不到所以未能实现,所以想写出来,和大家分享.有一点写一点,写得也不好,只要能看懂就行,就当学习笔记了.

开始零零碎碎写过一些文档,也向维基百科供过稿,但维基经常被ZF封锁,后来发现sf.net可以提供主机存放文档,便做了迁移.并开始了我的写作生涯.

这篇文档是作者20年来对工作的总结,是作者一点一滴的积累起来的,有些笔记已经丢失,所以并不完整.

因为工作太忙整理比较缓慢.目前的工作涉及面比较窄所以新文档比较少.

我现在花在技术上的时间越来越少,兴趣转向摄影,无线电.也想写写摄影方面的心得体会.

写作动力:

曾经在网上看到外国开源界对中国的评价,中国人对开源索取无度,但贡献却微乎其微.这句话一直记在我心中,发誓要为中国开源事业做我仅有的一点微薄贡献

另外写文档也是知识积累,还可以增加在圈内的影响力.

人跟动物的不同,就是人类可以把自己学习的经验教给下一代人.下一代在上一代的基础上再创新,不断积累才有今天.

所以我把自己的经验写出来,可以让经验传承

没有内容的章节:

目前我自己一人维护所有文档,写作时间有限,当我发现一个好主题就会加入到文档中,待我有时间再完善章节,所以你会发现很多章节是空无内容的.

文档目前几乎是流水帐式的写作,维护量很大,先将就着看吧.

我想到哪写到哪,你会发现文章没一个中心,今天这里写点,明天跳过本

章写其它的.

文中例子绝对多,对喜欢复制然后粘贴朋友很有用,不用动手写,也省时间.

理论的东西,网上大把,我这里就不写了,需要可以去网上查.

我爱写错别字,还有一些是打错的,如果发现请指正.

文中大部分试验是在Debian/Ubuntu/Redhat AS上完成.

写给读者

至读者:

我不知道什么时候,我不再更新文档或者退出IT行业去从事其他工作,我必须给这些文档找一个归宿,让他能持续更新下去。

我想捐赠给某些基金会继续运转,或者建立一个团队维护它。

我用了20年时间坚持不停地写作,持续更新,才有今天你看到的《Netkiller 手札》系列文档,在中国能坚持20年,同时没有任何收益的技术类文档,是非常不容易的。

有很多时候想放弃,看到外国读者的支持与国内社区的影响,我坚持了下来。

中国开源事业需要各位参与,不要成为局外人,不要让外国人说:中国对开源索取无度,贡献却微乎其微。

我们参与内核的开发还比较遥远,但是进个人能力,写一些文档还是可能的。

系列文档

下面是我多年积累下来的经验总结,整理成文档供大家参考:

程序猿，攻城狮，挨踢民工，Full Stack Developer, UNIX like
Evangelist, 业余无线电爱好者（呼号：BG7NYT），户外运动，山地骑
行以及摄影爱好者。

《Netkiller 系列 手札》的作者

成长阶段

1981年1月19日(庚申年腊月十四)出生于黑龙江省青冈县建设乡
双富大队第一小队

1989年9岁随父母迁居至黑龙江省伊春市，悲剧的天朝教育，不
知道那门子归定，转学必须降一级，我本应该上一年级，但体制让
我上学前班，那年多都10岁了

1995年小学毕业，体制规定借读要交3000两银子(我曾想过不升
初中)，亲戚单位分楼告别平房，楼里没有地方放东西，把2麻袋书
送给我，无意中发现一本电脑书BASIC语言，我竟然看懂了，对于
电脑知识追求一发而不可收，后面顶零花钱，压岁钱主要用来买电
脑书《MSDOS 6.22》《新编Unix实用大全》《跟我学
Foxbase》。。。。。。

1996年第一次接触UNIX操作系统，BSD UNIX, Microsoft
Xinux(盖茨亲自写的微软Unix，知道的人不多)

1997年自学Turbo C语言，苦于没有电脑，后来学校建了微机室才第一次使用QBASIC(DOS 6.22 自带命令)，那个年代只能通过软盘拷贝转播，Turbo C编译器始终没有搞到，

1997年第一次上Internet网速只有9600Bps, 当时全国兴起各种信息港域名格式是www.xxxx.info.net, 访问的第一个网站是NASA下载了很多火星探路者拍回的照片，还有“淞沪”sohu的前身

1998~2000年在哈尔滨学习计算机，充足的上机时间，但老师让我们练打字（明伦五笔/WT）打字不超过80个/每分钟还要强化训练，不过这个给我的键盘功夫打了好底。

1999年学校的电脑终于安装了光驱，在一张工具盘上终于找到了Turbo C, Borland C++与Quick Basic编译器，当时对VGA图形编程非常感兴趣，通过INT33中断控制鼠标，使用绘图函数模仿windows界面。还有操作UCDOS中文字库，绘制矢量与点阵字体。

2000年沉迷于Windows NT与Back Office各种技术，神马主域控制器，DHCP，WINS，IIS，域名服务器，Exchange邮件服务器，MS Proxy, NetMeeting...以及ASP+MS SQL开发；用56K猫下载了一张LINUX。ISO镜像，安装后我兴奋的24小时没有睡觉。

职业生涯

2001年来深圳进城打工,成为一名外来务工者. 在一个4人公司做PHP开发，当时PHP的版本是2.0, 开始使用Linux Redhat 6.2.当时很多门户网站都是用FreeBSD,但很难搞到安装盘，在网易社区认识了一个网友,从广州给我寄了一张光盘，FreeBSD 3.2

2002年我发现不能埋头苦干,还要学会"做人".后辗转广州工作了半年，考了一个Cisco CCNA认证。回到深圳重新开始，在车公庙找到一家工作做Java开发

2003年这年最惨,公司拖欠工资16000元,打过两次官司2005才付清.

2004 年开始加入[分布式计算](#)团队,[目前成绩](#)，工作仍然是Java开发并且开始使用PostgreSQL数据库。

2004-10月开始玩户外和摄影

2005-6月成为中国无线电运动协会会员,呼号BG7NYT,进了一部Yaesu FT-60R手台。公司的需要转回PHP与MySQL，相隔几年发现PHP进步很大。在前台展现方面无人能敌，于是便前台使用PHP，后台采用Java开发。

2006 年单身生活了这么多年,终于找到归宿. 工作更多是研究PHP各种框架原理

2007 物价上涨,金融危机，休息了4个月（其实是找不到工作），关外很难上439.460中继，搞了一台Yaesu FT-7800.

2008 终于找到英文学习方法， 《Netkiller Developer 手札》，《Netkiller Document 手札》

2008-8-8 08:08:08 结婚,后全家迁居湖南省常德市

2009 《Netkiller Database 手札》,2009-6-13学车，年底拿到C1驾照

2010 对电子打击乐产生兴趣，计划学习爵士鼓。由于我对Linux热爱，我轻松的接管了公司的运维部，然后开发运维两把抓。我印象最深刻的是公司一次上架10个机柜，我们用买服务器纸箱的钱改善伙食。我将40多台服务器安装BOINC做压力测试，获得了中国第二的名次。

2011 平凡的一年，户外运动停止，电台很少开，中继很少上，摄影主要是拍女儿与家人，年末买了一辆山地车

2012 对油笔画产生了兴趣，活动基本是骑行银湖山绿道，

2013 开始学习民谣吉他，同时对电吉他也极有兴趣；最终都放弃了。这一年深圳开始推数字中继2013-7-6日入手Motorola

MOTOTRBO XIR P8668, Netkiller 系列手札从Sourceforge向Github迁移; 年底对MYSQL UDF, Engine与PHP扩展开发产生很浓的兴趣, 拾起遗忘10+年的C, 写了几个mysql扩展(图片处理, fifo管道与ZeroMQ), 10月份入Toyota Rezi 2.5V并写了一篇《攻城狮的苦逼选车经历》

2014-9-8 在淘宝上买了一架电钢琴 Casio Privia PX-5S pro 开始陪女儿学习钢琴, 由于这家钢琴是合成器电钢, 里面有打击乐, 我有对键盘鼓产生了兴趣。

2014-10-2号罗浮山两日游, 对中国道教文化与音乐产生了兴趣, 10月5号用了半天时间学会了简谱。10月8号入Canon 5D Mark III + Canon Speedlite 600EX-RT香港过关被查。

2014-12-20号对乐谱制作产生兴趣
(<https://github.com/SheetMusic/Piano>), 给女儿做了几首钢琴伴奏曲, MuseScore制谱然后生成MIDI与WAV文件。

2015-09-01 晚饭后拿起爵士鼓基础教程尝试在Casio Privia PX-5S pro演练, 经过反复琢磨加上之前学钢琴的乐理知识, 终于在02号晚上, 打出了简单的基本节奏, 迈出了第一步。

2016 对弓箭(复合弓)产生兴趣, 无奈天朝法律法规不让玩。每周游泳轻松1500米无压力, 年底入 xbox one s 和 Yaesu FT-2DR, 同时开始关注功放音响这块

2017 7月9号入 Yamaha RX-V581 功放一台, 连接Xbox打游戏爽翻了, 入Kindle电子书, 计划学习蝶泳, 果断放弃运维和开发知识体系转攻区块链。

2018 从溪山美地搬到半岛城邦, 丢弃了多年攒下的家底。11月开始玩 MMDVM, 使用 Yaesu FT-7800 发射, 连接MMDVM中继板, 树莓派, 覆盖深圳湾, 散步骑车通联两不误。

2019 卖了常德的房子, 住了5次院, 哮喘反复发作, 决定停止电子书更新, 兴趣转到知乎, B站

2020 准备找工作

职业生涯路上继续打怪升级

3. 如何获得文档

下载 Netkiller 手札 (epub,kindle,chg,pdf)

EPUB <https://github.com/netkiller/netkiller.github.io/tree/master/download/epub>

MOBI <https://github.com/netkiller/netkiller.github.io/tree/master/download/mobi>

PDF <https://github.com/netkiller/netkiller.github.io/tree/master/download/pdf>

CHM <https://github.com/netkiller/netkiller.github.io/tree/master/download/chm>

通过 GIT 镜像整个网站

<https://github.com/netkiller/netkiller.github.com.git>

```
$ git clone https://github.com/netkiller/netkiller.github.com.git
```

镜像下载

整站下载

```
wget -m http://www.netkiller.cn/index.html
```

指定下载

```
wget -m wget -m http://www.netkiller.cn/linux/index.html
```

Yum 下载文档

获得光盘介质，RPM包，DEB包，如有特别需要，请联系我

YUM 在线安装电子书

<http://netkiller.sourceforge.net/pub/repo/>

```
# cat >> /etc/yum.repos.d/netkiller.repo <<EOF
[netkiller]
```

```
name=Netkiller Free Books
baseurl=http://netkiller.sourceforge.net/pub/repo/
enabled=1
gpgcheck=0
gpgkey=

    rm -f ${DESTDIR}/*.html ${DESTDIR}/*.png  
  
.PHONY: all check clean html validate
```

生成html

```
cp /usr/share/doc/docbook-xsl-saxon/examples/db2html.xsl .  
make html
```

4. PDF

```
sudo apt-get install docbook-xml docbook-xsl xsltproc fop
```

安装字体

```
sudo mkdir /usr/share/fonts/microsoft
```

将 C:\Windows\Fonts 目录中的字体复制到
/usr/share/fonts/microsoft

```
$ java -cp /usr/share/java/fop.jar  
org.apache.fop.fonts.apps.TTFReader  
/usr/share/fonts/microsoft/simhei.ttf simhei.xml  
$ java -cp /usr/share/java/fop.jar  
org.apache.fop.fonts.apps.TTFReader -ttcname "SimSun"  
/usr/share/fonts/microsoft/simsun.ttc simsun.xml
```

```
sudo vim /usr/share/xml/docbook/stylesheet/docbook-  
xsl/fo/param.xsl  
<xsl:param name="callout.unicode.font">simsun</xsl:param>  
<xsl:param name="symbol.font.family">simsun</xsl:param>  
<xsl:param name="callout.unicode.font">simsun</xsl:param>
```

```

$ vim fop.conf

<?xml version="1.0"?>
<fop version="1.0">
<base>.</base>

<renderers>
  <renderer mime="application/pdf">
    <filterList>
      <value>flate</value>
    </filterList>
    <fonts>
      <font metrics-url="simhei.xml" kerning="yes" embed-
url="/usr/share/fonts/microsoft/simhei.ttf">
        <font-triplet name="simhei" style="normal"
weight="normal"/>
        <font-triplet name="simhei" style="normal"
weight="bold"/>
        <font-triplet name="simhei" style="italic"
weight="normal"/>
        <font-triplet name="simhei" style="italic"
weight="bold"/>
      </font>
      <font metrics-url="simsun.xml" kerning="yes" embed-
url="/usr/share/fonts/microsoft/simsun.ttc">
        <font-triplet name="simsun" style="normal"
weight="normal"/>
        <font-triplet name="simsun" style="normal"
weight="bold"/>
        <font-triplet name="simsun" style="italic"
weight="normal"/>
        <font-triplet name="simsun" style="italic"
weight="bold"/>
      </font>
    </fonts>
  </renderer>
</renderers>
</fop>

```

```

                                xsltproc -o helloworld.fo
/usr/share/xml/docbook/stylesheet/docbook-xsl/fo/docbook.xsl
helloworld.xml

```

```
helloworld.pdf          fop -c fop.conf helloworld.fo -pdf
```

5. CHM

下载 [HTML Help Wordshop](#) 工具，并安装

```
copy "c:\Program Files\HTML Help  
Workshop\hhc.exe" d:\docbook\example  
docbook.xml xsltproc -xinclude docbook_chm.xsl  
hhc.exe htmlhelp.hhp
```

```
set PATH=C:\Program Files (x86)\HTML Help Workshop;%PATH%  
hhc htmlhelp.hhp
```

6. docbook2odf - Convert docbook document to Oasis Open Document

```
sudo apt-get install docbook2odf
```

```
docbook2odf book.xml
```

7. EPUB

7.1. 创建.epub文件

```
<?xml version="1.0" encoding="utf-8"?>
<book>
  <bookinfo>
    <title>My EPUB book</title>
    <author><firstname>Liza</firstname>
      <surname>Daly</surname></author>
    <volumenum>1234</volumenum>
  </bookinfo>
  <preface id="preface">
    <title>Title page</title>
    <figure id="cover-image">
      <title>Our EPUB cover image icon</title>
      <graphic fileref="cover.png"/>
    </figure>
  </preface>
  <chapter id="chapter1">
    <title>This is a pretty simple DocBook example</title>
    <para>
      Not much to see here.
    </para>
  </chapter>
  <chapter id="end-notes">
    <title>End notes</title>
    <para>
      This space intentionally left blank.
    </para>
  </chapter>
</book>
```

```
$ xsltproc
/usr/share/xml/docbook/stylesheet/docbook-xsl/epub/docbook.xsl
docbook.xml
$ echo "application/epub+zip" >
```

```
mimetype  
$ zip -0Xq my-book.epub  
mimetype  
$ zip -Xr9D my-book.epub *
```

7.2. Reader

<http://calibre-ebook.com/>

8. Apple Mac

安装 dtd 文件

```
neo@MacBook-Pro ~ % brew install docbook
```

安装目录 /usr/local/Cellar/docbook/5.0/docbook/xml/5.0

安装 xsl 文件

```
neo@MacBook-Pro ~ % brew install docbook-xsl
```

安装目录 /usr/local/Cellar/docbook-xsl/1.79.1/docbook-xsl/

```
neo@MacBook-Pro /tmp/doc % cat sample.xml
<?xml version="1.0" encoding="utf-8"?>
<book>
  <bookinfo>
    <title>My EPUB book</title>
    <author><firstname>Liza</firstname>
      <surname>Daly</surname></author>
    <volumenum>1234</volumenum>
  </bookinfo>
  <preface id="preface">
    <title>Title page</title>
    <figure id="cover-image">
      <title>Our EPUB cover image icon</title>
      <graphic fileref="cover.png"/>
    </figure>
  </preface>
  <chapter id="chapter1">
    <title>This is a pretty simple DocBook example</title>
```

```
<para>
    Not much to see here.
</para>
</chapter>
<chapter id="end-notes">
    <title>End notes</title>
    <para>
        This space intentionally left blank.
    </para>
</chapter>
</book>
```

```
neo@MacBook-Pro /tmp/doc % xsltproc /usr/local/Cellar/docbook-
xsl/1.79.1/docbook-xsl/html/chunk.xsl sample.xml
```

```
Writing pr01.html for preface(preface)
Writing ch01.html for chapter(chapter1)
Writing ch02.html for chapter(end-notes)
Writing index.html for book
```

```
neo@MacBook-Pro /tmp/doc % ll
```

```
total 40
```

```
-rw-r--r--  1 neo  wheel   1.6K Sep 28 16:51 ch01.html
-rw-r--r--  1 neo  wheel   1.5K Sep 28 16:51 ch02.html
-rw-r--r--  1 neo  wheel   1.8K Sep 28 16:51 index.html
-rw-r--r--  1 neo  wheel   1.8K Sep 28 16:51 pr01.html
-rw-r--r--  1 neo  wheel    710B Sep 28 16:51 sample.xml
```

9. docbook-website - XML Website DTD and XSL Stylesheets

```
sudo apt-get install docbook-website
```

```
#!/bin/bash
export
DSSSL=/usr/share/xml/docbook/stylesheet/nwalsh/xhtml/onechunk.x
sl
mkdir tmp
cd tmp
xsltproc --stringparam html.stylesheet docbook.css ${DSSSL}
../book.xml
```

10. XML 工具

10.1. rxp - A validating XML parser

```
rxp -s file.xml
```

To validate file.xml, use the command:

```
$ rxp -s -V file.xml
```

10.2. XML 校验

```
$ xmllint book.xml
```

11. SGML 环境

```
sudo apt-get install docbook-utils
```

CentOS

```
# yum install docbook*
```

第 3 章 docbook-xsl

1. HTML

1.1. example

```
<?xml version='1.0' encoding="utf-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"

</xsl:template>

</xsl:stylesheet>

```

1.2. Docbook参数

/usr/share/xml/docbook/stylesheet/nwalsh/xhtml/param.xsl

默认HTML格式输出文件中的章内小节是没有自动编号功能的，如果要实现小节自动编号需要设置HTML格式的两个转换参数。

section.autolabel参数为1代表章内小节可自动编号，为0表示不会自动编号；

section.label.includes.component.label参数为1表示章内小节编号包含章节编号，为0表示不包含章节编号。

设置这两个参数可通过命令行方式，也可通过修改XSL转换文件方法。下面分别介绍这两种方法：

通过命令行方式：

```
$ xsltproc --stringparam section.autolabel 1 \  
           --stringparam section.label.includes.component.label 1 \  
           docbook.xml myfile.xml>myfile.htm
```

修改XSL转换文件方式：

DocBook文档的HTML格式转换样式文件一般位于/usr/share/sgml/docbook/docbook-xsl-1.65.1/html/目录下。通过查看docbook.xsl文件可知，在docbook.xsl中引用param.xsl作为参数设置文件，所有的参数都在这里设置。我们打开param.xsl文件，找到以下两行，再把参数置成1就可以了。

```
<xsl:param name="section.autolabel" select="1"/>  
<xsl:param name="section.label.includes.component.label" select="1"/>
```

另一种方法

```
cat my_docbook.xsl  
<?xml version='1.0'?>  
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"  
                version='1.0'>  
<xsl:include  
href="/usr/share/xml/docbook/stylesheet/nwalsh/html/docbook.xsl"/>  
<xsl:output method="html"  
            encoding="UTF-8"  
            indent="no"/>  
</xsl:stylesheet>
```

```
xsltproc -o docbook.html my_docbook.xsl docbook.xml
```

1.3. 生成目录深度

总深度

```
<xsl:param name="toc.max.depth">8</xsl:param>
```

章节深度

```
<xsl:param name="toc.section.depth">2</xsl:param>
```

1.4. 字符集

UTF-8

```
--stringparam chunker.output.encoding
```

1.5. Filename prefix

base.dir parameter value	Description	Example
chunk filename		
base.dir="htmlout/"		Output directory only.
htmlout/chap1.html		
base.dir="refbook-"		Filename prefix only.
refbook-chap1.html		
base.dir="htmlout/refbook-"	Output directory and filename prefix.	
htmlout/refbook-chap1.html		

base.dir parameter

```
xsltproc --stringparam base.dir  
/usr/apache/htdocs/ chunk.xsl myfile.xml
```

2. htmlhelp

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet
xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
version="1.0">
    <xsl:import
href="/usr/share/xml/docbook/stylesheet/docbook-
xsl/htmlhelp/htmlhelp.xsl"/>
        <xsl:param name="htmlhelp.encoding">UTF-8</xsl:param>
        <xsl:param name="chunker.output.encoding">UTF-
8</xsl:param>
        <xsl:param name="htmlhelp.autolabel" select="1"/>
        <xsl:param
name="htmlhelp.hhc.section.depth">3</xsl:param>
        <xsl:param name="htmlhelp.hhc.show.root" select="0"/>
<!-- 1 目录收缩 0 目录展开 -->

        <xsl:param name="section.autolabel" select="1"/>
        <xsl:param
name="section.label.includes.component.label" select="1"/>
        <xsl:param name="bibliography.numbered" select="1"/>
        <xsl:param name="toc.max.depth">4</xsl:param>
        <xsl:param name="toc.section.depth">3</xsl:param>

        <!--
        <xsl:param name="htmlhelp.chm">neo.chm</xsl:param>
        <xsl:param name="htmlhelp.use.hhk" select="1"/>
        <xsl:param name="use.id.as.filename" select="1"/>
        -->

    <xsl:template name="user.footer.content">

    </xsl:template>

    <xsl:template name="user.footer.navigation">

<script type="text/javascript">

    var _gaq = _gaq || [];
```

```

_gaq.push(['_setAccount', 'UA-11694057-1']);
_gaq.push(['_setDomainName', 'netkiller.github.io']);
_gaq.push(['_setAllowLinker', true]);
_gaq.push(['_trackPageview']);

(function() {
  var ga = document.createElement('script'); ga.type =
'text/javascript'; ga.async = true;
  ga.src = ('https:' == document.location.protocol ?
'https://ssl' : 'http://www') + '.google-
analytics.com/ga.js';
  var s = document.getElementsByTagName('script')[0];
s.parentNode.insertBefore(ga, s);
})();

</script>

<script type="text/javascript">
var _bdhmProtocol = (("https:" == document.location.protocol)
? " https://" : " http://");
document.write(unescape("%3Cscript src='" + _bdhmProtocol +

第 4 章 DOCTYPE

1. SYSTEM

在线引用DOCTYPE头，这样在创建文档的时候速度会比较慢。

```
<?xml version="1.0" encoding="utf-8"?>
<!DOCTYPE book PUBLIC "-//OASIS//DTD DocBook V5.0//EN"
"http://www.oasis-open.org/docbook/xml/5.0/docbook.dtd">
```

我们也可使用本地的DTD文件

```
<!DOCTYPE subject SYSTEM
"/usr/share/xml/docbook/schema/dtd/4.5/docbookx.dtd" [
    <!ENTITY book.info.author.xml
SYSTEM "../common/book.info.author.xml">
    <!ENTITY book.info.legalnotice.xml
SYSTEM "../common/book.info.legalnotice.xml">
    <!ENTITY book.info.abstract.xml
SYSTEM "../common/book.info.abstract.xml">
    <!ENTITY book.preface.xml                      SYSTEM
"../common/book.preface.xml">
    <!ENTITY preface.about.me.xml                  SYSTEM
"../common/about.me.xml">

    <!ENTITY chapter.docbook
SYSTEM "chapter.docbook.xml">
    <!ENTITY chapter.docbook.doctype.xml          SYSTEM
"chapter.docbook.doctype.xml">
    <!ENTITY chapter.docbook.list.xml
SYSTEM "chapter.docbook.list.xml">
    <!ENTITY chapter.docbook.paragraphs.xml SYSTEM
"chapter.docbook.paragraphs.xml">
    <!ENTITY chapter.docbook.admonition.xml SYSTEM
```

```
"chapter.docbook.admonition.xml">
    <!ENTITY chapter.docbook-website.xml    SYSTEM
"chapter.docbook-website.xml">
    <!ENTITY chapter.docbook.epub.xml
SYSTEM "chapter.docbook.epub.xml">
]>
```

```
<!DOCTYPE article PUBLIC "-//FreeBSD//DTD DocBook XML V4.5-
Based Extension//EN" "../.../share/xml/freebsd45.dtd">
```

2. DTD 引用

2.1. 引用本地DTD

```
<!DOCTYPE subject SYSTEM  
"/usr/share/xml/docbook/schema/dtd/4.5/docbookx.dtd" [  
...  

```

2.2. oasis-open.org

```
<!DOCTYPE book PUBLIC "-//OASIS//DTD DocBook XML V5.0//EN"  
"http://www.oasis-open.org/docbook/xml/5.0b5/dtd/docbook.dtd" [  
...  

```

3. article

例 4.1. article

```
<!DOCTYPE article PUBLIC "-//OASIS//DTD DocBook V4.1//EN">

<article>
  <articleinfo>
    <title>An example article</title>

    <author>
      <firstname>Your first name</firstname>
      <surname>Your surname</surname>
      <affiliation>
        <address><email>foo@example.com</email></address>
      </affiliation>
    </author>

    <copyright>
      <year>2000</year>
      <holder>Copyright string here</holder>
    </copyright>

    <abstract>
      <para>If your article has an abstract then it should go

            <para></para>
        </abstract>
    </info>

    <preface>
```

```
        <title></title>
        <para></para>
    </preface>

    &chapter.database;

</book>
```

chapter.database.xml

```
<chapter>
    <title>Chapter 1</title>
</chapter>
```

6. xi:include

```
<book xmlns="http://docbook.org/ns/docbook"
xmlns:xi="http://www.w3.org/2001/XInclude">
<title>Book</title>
<xi:include href="ch1.xml"/>
<xi:include href="ch2.xml"/>
<xi:include href="ch3.xml"/>
<xi:include href="ch4.xml"/>
</book>
```

7. Docbook HTML 输出选项

HTML output options

7.1. 指定多页输出时html文档名

我们把docbook文档转换成html文档时，可以转换成一个大的html文档，也可以转换成多页的html文档。当转换成多页是，默认的文件是以ch01.html、ch02.html方式命名的，较不直观。我们可在docbook文档中添加一个属性，使它输出时按我们指定的文件名输出。

方法一：

```
<chapter><?dbhtml filename="first.html" ?>
<title>Introduction</title>
...
```

方法二：

```
<chapter id="first">
<title>Introduction</title>
...

xsltproc --stringparam use.id.as.filename 1 chunk.xsl
myfile.xml
```

7.2. 指定输出路径

默认转换后的文档是保存在当前目录的，我们可在xsltproc命令行用-o选项指定转换后文档的输出路径，另外一种是在docbook中指定。

```
<book><?dbhtml dir="neo" ?>
<title>Docbook Guide</title>
```

```
...  
<chapter id="first"><?dbhtml dir="technic" ?>  
...  
<chapter id="second">  
...  
<appendix id="three"><?dbhtml dir="read" ?>  
...
```

输出后的路径:

```
jims/index.html  
jims/technic/first.html  
jims/second.html  
jims/read/three.html
```

7.3. 包含HTML文件

```
...  
</para>  
<?dbhtml-include href="mycode.html"?>  
<?dbhtml-include href="../additonal.html"?>  
<para>  
...
```

7.4. 包含HTML节点

```
<xsl:template name="user.header.content">  
  <xsl:variable name="codefile"  
select="document('mycode.html',/)" />  
  <xsl:copy-of select="$codefile/htmlcode/node()" />  
</xsl:template>
```

7.5. 图标

Docbook icon graphics

Admonition graphics

admon.graphics 1

```
xsltproc --stringparam admon.graphics 1 docbook.xsl myfile.xml
```

导航图标

Navigational icons

```
xsltproc --stringparam navig.graphics 1 chunk.xsl myfile.xml
```

Callout icons

If you use callout graphics, then there are three parameters that give you more control over the generated img tag.

`callout.graphics.extension`

Use this parameter to change the icon file extension from .png to something else. Of course, you must have the graphics that match that extension.

`callout.graphics.path`

Use this parameter to change the generated directory name from the default images/callouts/. Be sure to include the trailing slash.

`callout.graphics.number.limit`

Use this parameter to set the highest number for which you have a callout graphic. The stylesheets are distributed with callout graphics files with numbers up to 15, but you could create graphics with additional numbers if you need them. If you have more numbers but you do not reset this parameter, then any

```
numbers over 15 will still format like (16).
```

7.6. dbhtml-include

包含html文件到当前页面

```
<?dbhtml-include href="file:///www/freebsd/faq.html"?>  
<?dbhtml-include  
href="http://www.example.org/freebsd/faq.html"?>
```

注意：需要开启下面两个选项才能生效

```
<xsl:param name="use.extensions" select="1"/>  
<xsl:param name="textinsert.extension" select="1"/>
```

7.7. 显示当前时间

```
<para>This document was generated <?dbtimestamp format="Y-m-d  
H:M:S"?>. </para>
```

```
<?dbtimestamp format="Y-m-d" padding="0" ?>
```

第 5 章 The DocBook HTML Forms Document Type

```
$ sudo apt-get install docbook-html-forms
```

To use this module, specify the public and system identifiers of this module in your document type declaration. For example, to use this module to write a book, use the following document type declaration:

```
<!DOCTYPE book PUBLIC "-//OASIS//DTD DocBook HTML Forms  
Module V1.2CR1//EN"  
    "http://www.oasis-  
open.org/docbook/xml/htmlforms/1.2CR1/dbforms.dtd">
```

Naturally, you can include an internal subset if you wish.

To incorporate this module into a higher-level customization layer, use the public and system identifiers of this module in your customization layer. For example:

```
<!DOCTYPE % docbookforms PUBLIC "-//OASIS//DTD DocBook HTML  
Forms Module V1.2CR1//EN"  
    "http://www.oasis-  
open.org/docbook/xml/htmlforms/1.2CR1/dbforms.dtd">  
%docbookforms;
```

第 6 章 book 书 / article 文章

1. info

bookinfo / articleinfo

1.1. affiliation

```
<affiliation>
  <shortaffil>IBM</shortaffil>
  <jobtitle>Senior LAMP Engineer</jobtitle>
  <orgname>ArborText, Inc.</orgname>
  <orgdiv>Application Development</orgdiv>
</affiliation>
```

1.2. address 地址

```
<address>
  <street>162 Guelph Street</street>
  <city>Georgetown</city>
  <state>ON</state>
  <country>Canada</country>
  <postcode>L7G 5X7</postcode>
  <phone>1-888-628-2028</phone>
  <fax>(905) 702-7851</fax>
  <email>info@cogent.ca</email>
  <otheraddr>www.cogent.ca</otheraddr>
</address>
```

1.3. reference 参考信息

```
<reference>
  <title>Reference</title>
  <refentry>
    (The content here is shown in the Reference Entries
    appendix.)
  </refentry>
</reference>
```

1.4. author 作者

```
<authorgroup>
  <author>

Topic Heading

You can use the Bridgehead element to create a heading between paragraphs, without creating a new section or sub-section.

4.3. sidebar

```
<sidebar>
  <title>A Sidebar</title>
  <para>
    Sidebar content.
  </para>
</sidebar>
```

A Sidebar

Sidebar content.

5. Paragraphs 段落

5.1. para 段落

```
<para>helloworld</para>
```

5.2. simpara 简单段落

```
<simpara>
    Just the text, ma'am.
</simpara>
```

Just the text, ma'am.

5.3. formalpara 带标题的段落

```
<formalpara>
  <title>A Formal Paragraph</title>
  <para>has a title that appears in bold, and a body
paragraph.
  The title paragraph is incorporated into the body paragraph
in HTML,
  and is separate in PDF. The body paragraph is a regular
<para>
  paragraph, and there is only one body paragraph allowed per
formal
  paragraph.</para>
</formalpara>
```

A Formal Paragraph. has a title that appears in bold, and a body paragraph. The title paragraph is incorporated into the body paragraph in HTML, and is separate in PDF. The body paragraph is a regular `<para>` paragraph, and there is only one body paragraph allowed per formal paragraph.

5.4. 产品名

```
<para>  
<productname class='trade'>Frobozz</productname>: it's not  
just for breakfast anymore.  
</para>
```

Frobozz™ : it's not just for breakfast anymore.

5.5. TM 商标

```
<trademark>Microsoft</trademark>
```

Microsoft™

5.6. 字体

Font Formatting Codes

webpage
wiki
```

5.8. medialabel

```
<para>
To install <application>The Great Foo</application>, insert
```

the disk
labelled <medialabel>TGF Setup 1</medialabel> and run
<command>setup</command>.
</para>

<para>
The weekly incremental backup tape is labelled
<medialabel>Backup <replaceable>nn</replaceable>
</medialabel>, where
<replaceable>nn</replaceable> is the week number.
</para>

To install The Great Foo , insert the disk labelled *TGF Setup 1* and run **setup** .

The weekly incremental backup tape is labelled *Backup nn* , where *nn* is the week number.

6. blockquote 内容引用

```
<blockquote>
  <para>
    This text should be indented.
  </para>
</blockquote>
```

This text should be indented.

7. epigraph 题词

```
<epigraph>
  <attribution>William Safire</attribution>
  <para>
    Knowing how things work is the basis for
appreciation, and is
    thus a source of civilized delight.
  </para>
</epigraph>
```

```
<epigraph>

<attribution>
  <ulink url="http://www.margepiercy.com/">Marge
Piercy</ulink>
</attribution>

<para>
  Life is the first gift, love is the second, and
understanding is the third.
</para>

</epigraph>
```

Knowing how things work is the basis for appreciation, and is thus a source of civilized delight.

—William Safire

8. 计算机专业标签

8.1. 软件名称

```
<para>  
<application>Word Perfect</application> is one of several  
word  
processors to claim support for <acronym>SGML</acronym>.  
</para>
```

Word Perfect is one of several word processors to claim support for SGML .

8.2. 硬件名称

```
<para>  
The <acronym>IRQ</acronym> of the <hardware>SCSI  
Controller</hardware>  
can be set to 7, 11, or 15. The factory default setting is  
7.  
</para>
```

The IRQ of the SCSI Controller can be set to 7, 11, or 15. The factory default setting is 7.

8.3. 数据库

```
<para>
The <database>ProjectStatus</database> database has been
updated.
Please note that <database class='field'>Year</database> has
been
extended to four digits.
</para>
```

The ProjectStatus database has been updated. Please note that Year has been extended to four digits.

8.4. 程序标签

函数

```
<funcprototype>
  <funcdef>void <function>sort</function></funcdef>
    <paramdef>int *<parameter>arr</parameter>[ ]</paramdef>
    <paramdef>int <parameter>(* comp)</parameter>
      <funcparams>int *, int *</funcparams></paramdef>
</funcprototype>
```

```
void sort ( arr,
            (* comp));

int * arr [ ] ;
int (* comp) (int *, int *) ;
```

类名

```
<para>
    All user-interface components must be descendants of
the
    <classname>Widget</classname>
    class.
</para>
```

All user-interface components must be descendants of the widget class.

变量名

```
<para>
    In Perl,
    <varname>@ARGV</varname>
    contains the command line parameters
    used when the script was run.
</para>
```

In Perl, @ARGV contains the command line parameters used when the script was run.

synopsis

```
<synopsis>
chgrp [-R [-H | -L | -P]] [-f] group file...
</synopsis>
```

group file... chgrp [-R [-H | -L | -P]] [-f]

<para>
In ACL, <constant>main::PCS</constant> contains the path component separator character.
</para>
<para>
The maximum legal length for a path name is <constant class='limit'>PATH_MAX</constant>, defined in <filename class='headerfile'>limits.h</filename>.
</para>

In ACL, main::PCS contains the path component separator character.

The maximum legal length for a path name is PATH_MAX , defined in limits.h .

8.5. 命令

<para>
In <acronym>UNIX</acronym> ,
<command>ls</command> is used to get a directory listing.
</para>

In UNIX , ls is used to get a directory listing.

参数

```
<para>
Using the <parameter class='command'>/w</parameter> parameter
on the
DOS <command>dir</command> command prints a wide directory
listing.
</para>
```

Using the `/w` parameter on the DOS **dir** command prints a wide directory listing.

环境变量

```
<para>
In order to translate public identifiers into local system
identifiers,
<application>Jade</application> and
<application>SP</application> read the catalog files
pointed to by <envar>SGML_CATALOG_FILES</envar>.
</para>
```

In order to translate public identifiers into local system identifiers, Jade and SP read the catalog files pointed to by `SGML_CATALOG_FILES` .

输入提示

```
<para>
Enter your user name when the system presents the
<prompt>login:</prompt> prompt.
</para>
```

Enter your user name when the system presents the login: prompt.

用户输入

```
<para>
At the system prompt, enter <userinput>xyzzzy</userinput> to
gain
supervisor access to the system.
</para>
```

At the system prompt, enter **xyzzzy** to gain supervisor access to the system.

主机名

```
<para>
For many years, O'Reilly's primary web server,
<ulink
url="http://www.oreilly.com/">http://www.oreilly.com/</ulink>
,
was hosted by <application>WN</application> on
<systemitem
class="systemname">helio.oreilly.com</systemitem>.
</para>
```

For many years, O'Reilly's primary web server,
<http://www.oreilly.com/> , was hosted by WN on helio.oreilly.com .

文件名

```
<para>
The symbolic constants for error numbers are defined in
<filename class='headerfile'>errno.h</filename> in
<filename class='directory'>/usr/include/sys</filename>.
</para>
```

The symbolic constants for error numbers are defined in `errno.h` in `/usr/include/sys` .

cmdsynopsis

```
<cmdsynopsis>
  <command>cd</command>
  <arg choice='req'><replaceable>directory</replaceable>
</arg>
</cmdsynopsis>

<cmdsynopsis>
  <command>cal</command>

  <arg rep='repeat'>-l <replaceable>file</replaceable></arg>
  <arg rep='repeat' choice='plain'>
<replaceable>file</replaceable></arg>
</cmdsynopsis>

```

`cd { directory }`

`cal [-j] [-y] [month [year]]`

`chgrp [-R [[-H] | [-L] | [-P]]] [-f] group file ...`

`emacs [-t file] [-q] [-u user] [+ number] [-f function ...]
[-l file ...] file ...`

命令参数可选项

```

<para>
The <option>-a</option> option on the <acronym>UNIX</acronym>
<command>ls</command> command or the <option>/r</option>
option on the
<acronym>DOS</acronym> <command>attrib</command>
command, for example.

```

```
</para>

<synopsis>
ls <optional><option>-abcCdfFgillMnopqrRstuxl</option>
</optional>
    <optional>names</optional>
</synopsis>
```

The `-a` option on the UNIX `ls` command or the `/r` option on the DOS **attrib** command, for example.

```
ls
[
    -
abcCdfFgillMnopqrRstuxl
]
[names]
```

终端输出

```
<para>
The output from the date command,
<computeroutput>Sun Nov 16, 1997 21:03:29</computeroutput>,
uses fixed-width fields so that it can easily be parsed.
</para>
```

The output from the date command, Sun Nov 16, 1997 21:03:29 , uses fixed-width fields so that it can easily be parsed.

第 8 章 Lists 项目符号与编号

calloutlist, glosslist, itemizedlist, listitem, orderedlist, segmentedlist, simplelist, variablelist

1. itemizedlist 符号列表

itemizedlist

```
<itemizedlist>
  <listitem><para>item 1</para></listitem>
  <listitem><para>item 2</para></listitem>
  <listitem><para>item 3</para></listitem>
</itemizedlist>
```

- item 1
- item 2
- item 3

```
<itemizedlist mark='opencircle'>
<listitem>
<para>
Item 1
</para>
</listitem>
<listitem override='bullet'>
<para>
Item 2
</para>
</listitem>
```

```
<listitem>
<para>
Item 3
</para>
</listitem>
</itemizedlist>
```

- Item 1
- Item 2
- Item 3

2. orderedlist 编号列表

普通列表 orderedlist

```
<orderedlist>
  <title>普通列表</title>
  <listitem><para>列表内容 1</para></listitem>
  <listitem><para>列表内容 2</para></listitem>
  <listitem><para>列表内容 3</para></listitem>
</orderedlist>
```

有序列表可以指定序号形式（arabic, upperalpha, loweralpha, upperroman, lowerroman）

```
<orderedlist numeration="lowerroman">
  <listitem><para>One</para></listitem>
  <listitem><para>Two</para></listitem>
  <listitem><para>Three</para></listitem>
  <listitem><para>Four</para></listitem>
</orderedlist>
```

普通列表

1. 列表内容 1
2. 列表内容 2
3. 列表内容 3

3. simplelist 简单列表

简单列表只是分行显示

例 8.1. SimpleList

```
<para>Here is a <tag>SimpleList</tag>, rendered inline:  
<simplelist type='inline'  
<member>A</member>  
<member>B</member>  
<member>C</member>  
<member>D</member>  
<member>E</member>  
<member>F</member>  
<member>G</member>  
</simplelist>  
</para>
```

Here is a SimpleList ,rendered inline: A, B, C, D, E, F, G

```
<para>Here is the same <tag>SimpleList</tag> rendered  
horizontally with  
three columns:  
<simplelist type='horiz' columns='3'  
<member>A</member>  
<member>B</member>  
<member>C</member>  
<member>D</member>  
<member>E</member>  
<member>F</member>  
<member>G</member>  
</simplelist>  
</para>
```

Here is the same simpleList rendered horizontally with three columns:

A B C

D E F

G

```
<para>Finally, here is the list rendered vertically:  
<simplelist type='vert' columns='3'>  
<member>A</member>  
<member>B</member>  
<member>C</member>  
<member>D</member>  
<member>E</member>  
<member>F</member>  
<member>G</member>  
</simplelist>  
</para>
```

Finally, here is the list rendered vertically:

A D G

B E

C F

4. variablelist 定义列表

定义列表主要用于名词解释

```
<variablelist>
  <title>A variable list</title>
  <varlistentry>
    <term>First term</term>
    <listitem>
      <para>Definition or explanation.</para>
    </listitem>
  </varlistentry>
  <varlistentry>
    <term>Second term</term>
    <listitem>
      <para>Definition or explanation.</para>
    </listitem>
  </varlistentry>
</variablelist>
```

A variable list

First term

Definition or explanation.

Second term

Definition or explanation.

```
<variablelist>
  <title>Font Filename Extensions</title>
```

```

<varlistentry>
  <term>
    <filename>TTF</filename>
  </term>
</listitem>
  <para>TrueType fonts.</para>
</listitem>
</varlistentry>
<varlistentry>
  <term>
    <filename>PFA</filename>
  </term>
  <term>
    <filename>PFB</filename>
  </term>
</listitem>
  <para>
    PostScript fonts.
    <filename>PFA</filename>
    files are common on
    <acronym>UNIX</acronym>
    systems,
    <filename>PFB</filename>
    files
    are more common on Windows
systems.
  </para>
</listitem>
</varlistentry>
</variablelist>

```

Font Filename Extensions

TTF

TrueType fonts.

PFA , PFB

PostScript fonts. PFA files are common on UNIX systems, PFB files are more common on Windows systems.

5. segmentedlist

```
<segmentedlist>
  <segtitle>Name</segtitle>
  <segtitle>Occupation</segtitle>
  <segtitle>Favorite Food</segtitle>
  <seglistitem>
    <seg>Tux</seg>
    <seg>Linux mascot</seg>
    <seg>Herring</seg>
  </seglistitem>
  <seglistitem>
    <seg>Konqui</seg>
    <seg>The KDE Dragon</seg>
    <seg>Gnomes</seg>
  </seglistitem>
</segmentedlist>
```

Name: Tux

Occupation: Linux mascot

Favorite Food: Herring

Name: Konqui

Occupation: The KDE Dragon

Favorite Food: Gnomes

6. procedure 过程

procedure

```
<procedure>
  <step>
    <para>Do this.</para>
  </step>

  <step>
    <para>Then do this.</para>
  </step>

  <step>
    <para>And now do this.</para>
  </step>
</procedure>
```

```
<procedure>
  <title>A procedure</title>
  <step>
    <para>Step 1.</para>
  </step>
  <step>
    <para>Step 2.</para>
    <substeps>
      <step>
        <para>Substep a.</para>
      </step>
      <step>
        <para>Substep b.</para>
      </step>
    </substeps>
  </step>
  <step>
```

```
<para>Step 3.</para>  
</step>  
</procedure>
```

1. Do this.
2. Then do this.
3. And now do this.

过程 8.1. A procedure

1. Step 1.
2. Step 2.
 - a. Substep a.
 - b. Substep b.
3. Step 3.

7. question/answer 问答

```
<qandaset>
  <qandaentry>
    <question>
      <para>What are little boys made of?
    </para>
    </question>
    <answer>
      <para>Snips and snails and puppy dog
tails.</para>
    </answer>
  </qandaentry>
  <qandaentry>
    <question>
      <para>What are little girls made of?
    </para>
    </question>
    <answer>
      <para>Sugar and spice and everything
nice.</para>
    </answer>
  </qandaentry>
</qandaset>
```

7.1. What are little boys made of?

Snips and snails and puppy dog tails.

7.2. What are little girls made of?

Sugar and spice and everything nice.

```
<article xmlns='http://docbook.org/ns/docbook'>
  <title>Example qandaset</title>

  <qandaset defaultlabel='qanda'>
    <qandaentry>
      <question>
        <para>To be, or not to be?</para>
      </question>
      <answer>
        <para>That is the question.</para>
      </answer>
    </qandaentry>
  </qandaset>
</article>
```

问： To be, or not to be?

答： That is the question.

8. glosslist 注解

```
<article xmlns='http://docbook.org/ns/docbook'>
  <title>Example glosslist</title>

```
                                </para>
                                </footnote>
                                will be charged on all balances carried
forward.
                                </para>
```

During the installation of the product ^[1] you may see messages such as these.

An annual percentage rate (APR) of 13.9% ^[2] will be charged on all balances carried forward.

^[1]-In versions 2.3 and 2.4.

^[2]-The prime rate, as published in the *Wall Street Journal* on the first business day of the month, plus 7.0%.

5. lot — A list of the titles of formal objects (as tables or figures) in a document

```
<lot>
    <title>List of Figures</title>
    <lotentry pagenum='5'>The Letters inside their
boxes</lotentry>
    <lotentry pagenum='15'>Example figure produced
by both TeX and troff</lotentry>
    <!-- ... -->
</lot>
```

第 14 章 equation 公式

```
<equation>
  <title>Fermat's Last Theorem</title>
  <alt>x^n + y^n ≠ z^n ∀ n ≠ 2</alt>
  <mathphrase>

x<superscript>n</superscript>+y<superscript>n</superscript>≠z
<superscript>n</superscript>
  ∀ n ≠ 2
  </mathphrase>
</equation>

<informalequation>
  <alt>e^(pi*i) + 1 = 0</alt>
  <mediaobject>
    <imageobject condition="print"><imagedata
filerref="figs/print/db5d_refeqn02.pdf"/></imageobject>
    <imageobject condition="web"><imagedata
filerref="figs/web/db5d_refeqn02.png"/></imageobject>
  </mediaobject>
</informalequation>
```

公式 14.1. Fermat's Last Theorem

$$x^n + y^n \neq z^n \forall n \neq 2$$

1. 引用latex公式

```
<para>
A presentation system using TeX as a back end might allow you
to insert inline markup, such as <markup
role="tex">$x^2$</markup>, using TeX syntax directly.
```

</para>

A presentation system using TeX as a back end might allow you to insert inline markup, such as x^2 , using TeX syntax directly.

部分 II. Tex

第 15 章 Document Tools

1. texlive - TeX Live: A decent selection of the TeX Live packages

```
sudo apt-get install texlive
```

1.1. 安装 XeTeX

<http://zh.wikipedia.org/wiki/XeTeX>

xeTeX是与tex平级的，都是排版引擎，而xeLatex和Latex刚分别基于两者的宏包。不同的是xeTeX支持Unicode, 可以直接支持中文。

XeLaTeX是使用LaTeX的排版引擎

install usage apt-get

<http://scripts.sil.org/xetex>

```
$ sudo apt-get install texlive-xetex lmodern  
$ sudo apt-get install texlive-latex-extra texlive-latex-recommended
```

1.2. XeLaTeX

安装XeTeX后现在我们尝试创建一个PDF文档

演示怎么创建文档

```
\documentclass[12pt,a4paper]{article}
```

```
\usepackage{fontspec}
\usepackage{xunicode}
\usepackage{xltextra}
\setmainfont[Mapping=tex-text]{WenQuanYi Micro Hei}
\begin{document}
\XeTeX 可以使用系统自带的字体，而不需要再另外生成。
\end{document}
```

xelatex a.tex

1.3. 安装字体

查看已经安装的字体

```
$ fc-list :lang=zh
/usr/share/fonts/truetype/droid/DroidSansFallbackFull.ttf:
Droid Sans Fallback:style=Regular
```

安装字体，将字体复制到/usr/share/fonts目录中，然后运行下面的命令。

```
$ sudo mkdir /usr/share/fonts/windows
$ sudo cp /media/Windows/Fonts/{SIM,sim}*
/usr/share/fonts/windows/
```

安装免费字体

```
$ sudo apt-get install xfonts-wqy ttf-wqy-microhei ttf-wqy-zenhei
```

更新字体

```
$ sudo mkfontscale
```

```
$ sudo mkfontdir
$ sudo fc-cache -fv
```

查看字体

```
$ fc-list :lang=zh
/usr/share/fonts/windows/msyh.ttf: Microsoft YaHei, 微软雅
黑:style=Regular,Normal,obyčejné,Standard,Κανονικά,Normaali,Norm

\title{\whei XeTeX使用小结}

```

```

\author{\fsong 何勃亮}

```

```

\date{\kai2009年6月21日}

```

```

\maketitle

```

```

\section{简介}

```

以前使用CJK进行中文的排版，需要自己生成字体库，近日，出现了XeTeX，可以比较好的解决中文字体问题，不需要额外生成LaTeX字体库，直接使用计算机系统里的字体。

```

\section{字体列表}

```

本文使用了大量本机自带的字体。

```

\begin{table}[htbp]

```

```

\caption{字体列表}

```

```

\centering
\begin{tabular}{|l|c|r|}

```

例 15.1. example.tex

```
\documentclass{article}
\usepackage{CJK}
\begin{document}
\begin{CJK*}{UTF8}{simsun}
中文
\end{CJK*}
\end{document}
```

生成html文件

```
latex2html -split 0 example.tex
```

Fonts

```
neo@master:~$ cd /usr/share/fonts/
neo@master:/usr/share/fonts$ cp -r /home/neo/Fonts .
neo@master:/usr/share/fonts$ sudo cp -r /home/neo/Fonts .

neo@master:/usr/share/fonts$ cd Fonts/
neo@master:/usr/share/fonts/Fonts$ sudo mkfontscale
neo@master:/usr/share/fonts/Fonts$ sudo mkfontdir
neo@master:/usr/share/fonts/Fonts$ sudo fc-cache
```

6. TeXstudio(LaTeX 编辑器)

<http://texstudio.sourceforge.net/>

第 16 章 编码转换

gb2312转utf-8

```
for f in `find .`; do [ -f $f ] && perl -MEncode -pi -e  
'$_=encode_utf8(decode(gb2312=>$_))' $f; done;
```

第 17 章 排版

选择A4纸

```
\documentclass[a4paper,12pt]{book}
```

设置页边距

Word中默认的页边距为 上边距=2.54cm, 下边距=2.54cm, 左边距=3.17cm, 右边距=3.17cm

```
\usepackage[top=1in,bottom=1in,left=1.25in,right=1.25in]{geometry}
```

我的习惯 2cm

```
\usepackage[top=20mm,bottom=20mm,left=20mm,right=20mm]{geometry}
```

第 18 章 文章的组成元素

标题

```
\title{文章的题目}  
\author{作者姓名}  
\date{2005/09/23}  
\maketitle
```

abstract

```
\begin{abstract}  
    put your abstract here...  
\end{abstract}
```

目录

```
\tableofcontents
```

章节

```
\chapter{章的名称}  
\section{节的名称}  
\subsection{小节的名称}  
\subsubsection{子节的名称}
```

索引

```
\printindex
```

参考文献

```
\begin{thebibliography}  
\bibitem{}参考文献1  
\bibitem{}参考文献2  
\end{thebibliography}
```

例 18.1. article.tex

```
% This is a comment line  
  
\documentclass{article}  
  
\begin{document}  
  
% Note to self:  
%   I must change this title later!  
\title{Hello World}  
  
\author{Your Name\\  
        Department of Computer Science\\  
        Courant Institute, NYU}  
\maketitle  
  
\begin{abstract}  
    ...put your abstract here...  
\end{abstract}  
  
\section{First Section}  
    ...text...  
\subsection{First subsection}  
    ...text...  
\subsection{Second subsection}  
    ...text...  
\section{Second Section}  
    ...text...  
  
...and so on...  
\end{document}
```

例 18.2. book.latex

```
% This is a comment line

\documentclass{article}

\begin{document}

% Note to self:
%   I must change this title later!
\title{Hello World}

\author{Your Name\\
        Department of Computer Science\\
        Courant Institute, NYU}
\maketitle

\begin{abstract}
    ...put your abstract here...
\end{abstract}

\chapter{First Chapter}
    ...text...
\section{First Section}
    ...text...
\subsection{First subsection}
    ...text...
\subsection{Second subsection}
    ...text...

\chapter{Second Chapter}
    ...text...
\section{Second Section}
    ...text...

...and so on...
\end{document}
```

第 19 章 Fonts

you can have bold font, italics font, etc as follows:

```
{\bf This is in bold} and  
{\it this is in italics}  
and this is in default roman  
{\rm as is this}.
```

1. Sizes

```
\tiny  
\scriptsize  
\footnotesize  
\small  
\normalsize  
\large  
\Large  
\LARGE  
\huge  
\Huge
```

2. Styles

Here is a simple example that will probably show you all you need to know about bold, italics, and underlining.

```
When something is \emph{really}, \textbf{really} important,  
you can \underline{underline it}, \emph{italicize it},  
\textbf{bold it}. If you \underline{\textbf{\emph{must do all  
three}}}, then you can nest them.
```

第 20 章 项目符号和编号

项目符号

```
\begin{itemize}
\item 我的第一个项目
\item 我的第二个项目
\item 我的第三个项目
\end{itemize}
```

项目编号

```
\begin{enumerate}
\item 我的第一个项目
\item 我的第二个项目
\item 我的第三个项目
\end{enumerate}
```

修改 \enumerate 的编号格式

```
\usepackage{enumerate}
```

然后enumerate环境就可以使用一个可选参数，像这样：

```
\begin{enumerate}[(a)]
\item  $(p \rightarrow (q \rightarrow p))$ ;
\item  $((q \text{lor } r) \rightarrow (\neg r) \rightarrow q)$ ;
\end{enumerate}
```

[]里面的 (a) 出来的结果是 (a)(b)(c)(d)这样子的。还可以用如下的：

1, 得到1,2,3,4....

i, 得到i,ii,iii.....

I, 得到I,II,III....

a, 得到a,b,c,d.....

A, 得到A,B,C,D....

还可以加各种修饰，比如

[Exer. i], 得到 Exer. i, Exer. ii, Exer. iii, Exer. iv, 等等

你要的这种结果稍微麻烦一点，要把[]用花括号括起来

```
\begin{enumerate}[\l{}1{\l}]
\item  $(p \rightarrow (q \rightarrow p))$ ;
\item  $((q \lor r) \rightarrow (\neg r) \rightarrow q)$ ;
\end{enumerate}
```

无符号

```
\begin{description}
\item 我的第一个项目
\item 我的第二个项目
\item 我的第三个项目
\end{description}

\begin{description}
\item[(a)] First item...
\item[(b)] Second item...
\end{description}
```

第 21 章 表格

使用tabular 环境可以生成表格，见下面这个例子：

```
\begin{tabular}{|c|c|c|c|c|c|}  
\hline\\  
编号 & 姓名 & 性别 & 年龄 & 地址 & 电话号码\\  
\hline\\  
1      & 张三 & 男 & 45 & 重庆工学院 & 12345678\\  
\hline\\  
2 & 李四 & 女 & 29 & 重庆杨家坪 & 654321\\  
\hline  
\end{tabular}
```

这里要注意了，我们在第一行中，有几个 c 就表示有几列，c 表示你的列是居中对齐的，如果你想居左或居右，请用 l 或 r。如果你的某行中的某一列是空的，你也要列出来，放个空格在那里就行了，你甚至可以什么都不放，在要空的那里前后各放一个 & 符号就行。在这里看到，对齐是用 & 来实现的，我们前面说过。竖线是用 c 两边的那些竖杠实现的，横线是用命令 \hline 来实现的。如果你不想要这些线，你可以把它们去掉。

第 22 章 图片

`\documentclass[12pt]{article}` 下面加入

```
\usepackage{graphicx}
```

插入图片

```
\includegraphics[width=0.8\textwidth]{fig1.eps}
```

```
\begin{figure}[htp]
  \begin{center}
    \includegraphics[width=450pt]{image/arch_02.png}
    \caption{描述文字}
    \label{fig:arch_02}
  \end{center}
\end{figure}
```

第 23 章 分割章节

main.tex

```
\documentclass{article}
\usepackage{amsmath}
\usepackage{CJK}
\begin{document}
\begin{CJK*}{GBK}{song}

\input{sec1.tex}
\include{sec2.tex}
\end{CJK*}
```

sec1.tex

```
\section{第一节}
恭承嘉惠兮，俟罪长沙。侧闻屈原兮，自沉汨罗。造托湘流兮，敬吊先生。
```

sec2.tex

```
\section{第一节}
贾生名谊，洛阳人也。年十八，以能诵诗属书闻于郡中。
```

第 24 章 参考文献

```
\begin{thebibliography}{}  
\bibitem[Gelman et al., 2004]{Gelman} Gelman, A., Carlin, J.  
B., Stern, H. S. \& Rubin, D. B.  
  (2004) Bayesian Data Analysis (Second Edition). \newblock  
Chapman \& Hall/CRC.  
\end{thebibliography}  
\clearpage  
\end{document}
```

第 25 章 Markdown

<http://daringfireball.net/projects/markdown/>

1. 章节

```
A First Level Header
=====
```

```
A Second Level Header
-----
```

#数量从1到6个代表HTML中的 H1...H6

```
# 这是 H1
```

```
## 这是 H2
```

```
##### 这是 H6
```

```
# 这是 H1 #
```

```
## 这是 H2 ##
```

```
### 这是 H3 ###
```

2. 项目符号与编号

项目符号

- * Candy.
- * Gum.
- * Booze.

- + Candy.
- + Gum.
- + Booze.

- Candy.
- Gum.
- Booze.

编号

1. Bird
2. McHale
3. Parish

3. 引用

块引用

```
> This is a blockquote with two paragraphs. Lorem ipsum dolor  
sit amet,  
> consectetur adipiscing elit. Aliquam hendrerit mi posuere  
lectus.  
> Vestibulum enim wisi, viverra nec, fringilla in, laoreet  
vitae, risus.  
>  
> Donec sit amet nisl. Aliquam semper ipsum sit amet velit.  
Suspendisse  
> id sem consectetur libero luctus adipiscing.
```

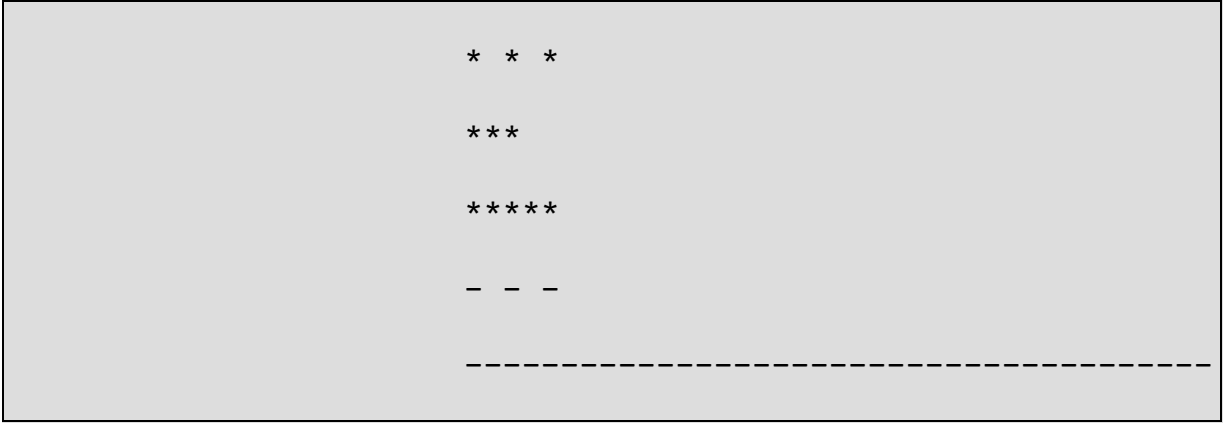

```
> This is the first level of quoting.  
>  
> > This is nested blockquote.  
>  
> Back to the first level.
```

4. Code

4.1. JSON

```
```json
{"nickname":"netkiller"}
```
```

5. 分割线

6. 连接

```
                This is [an example]
(http://example.com/ "Title") inline link.

                [This link](http://example.net/) has no
title attribute.
```

7. 图片

```
![Alt text](/path/to/img.jpg)
![Alt text](/path/to/img.jpg "Optional
title")
```

8. 字体格式

强调

single asterisks

single underscores

****double asterisks****

__double underscores__

9. 范例

第 26 章 Jekyll

<http://jekyllrb.com/>

1. 安装 Jekyll

1.1. Ubuntu

```
sudo apt-get install ruby jekyll
```

2. 创建 Jekyll 项目

```
$ jekyll new my-web-site  
$ cd my-web-site  
$ jekyll serve
```

<http://192.168.4.7:4000/>

3. permalink

_config.yml: 配置permalink格式

```
permalink: /:year/:month/:day/:title
```

4. _post

样式

```
layout: post
```

标题

```
title: "FreeBSD"
```

文章分类

```
categories: ebook
```

5. category / categories

使用Category进行文章分类

使用 `{{ category | first }}` 输出分类的名称
使用 `{{ category | last | size }}` 输出该分类下文章的数目
遍历 `category.last` 输出所有文章的信息，构建到该文章的索引目录

单一分类

```
---  
layout: Template  
title: Category Sample  
category: computer  
---
```

多个分类

```
---  
layout: Template  
title: Category Sample  
categories: [linux, freebsd]  
---
```

显示分类名称

```
{% for category in site.categories %}  
    {{ category | first }}  
{% endfor %}
```

```
{% for category in site.categories %}  
    <h2>{{ category | first }}</h2> </span>{{ category |
```

```
last | size }}</span>
    <ul class="arc-list">
        {% for post in category.last %}
        <li>{{ post.date | date:"%d/%m/%Y"}}<a href="{{
post.url }}">{{ post.title }}</a></li>
        {% endfor %}
    </ul>
{% endfor %}
```

第 27 章 Sphinx

<http://sphinx-doc.org/>

1. 安装 Sphinx

1.1. Ubuntu

```
$ sudo apt-get install python3-sphinx
```

2. 建立sphinx工程

运行sphinx-quickstart创建项目

```
$ sphinx-quickstart
Welcome to the Sphinx 1.2.2 quickstart utility.

Please enter values for the following settings (just press
Enter to
accept a default value, if one is given in brackets).

Enter the root path for documentation.
> Root path for the documentation [.]: Sphinx

You have two options for placing the build directory for Sphinx
output.
Either, you use a directory "_build" within the root path, or
you separate
"source" and "build" directories within the root path.
> Separate source and build directories (y/n) [n]:

Inside the root directory, two more directories will be
created; "_templates"
for custom HTML templates and "_static" for custom stylesheets
and other static
files. You can enter another prefix (such as ".") to replace
the underscore.
> Name prefix for templates and static dir [_]:

The project name will occur in several places in the built
documentation.
> Project name: Neo
> Author name(s): Neo

Sphinx has the notion of a "version" and a "release" for the
software. Each version can have multiple releases. For example,
for
Python the version is something like 2.5 or 3.0, while the
release is
something like 2.5.1 or 3.0a1. If you don't need this dual
structure,
```

just set both to the same value.

> Project version:

* Please enter some text.

> Project version: 0.0.1

> Project release [0.0.1]:

The file name suffix for source files. Commonly, this is either ".txt"

or ".rst". Only files with this suffix are considered documents.

> Source file suffix [.rst]:

One document is special in that it is considered the top node of the

"contents tree", that is, it is the root of the hierarchical structure

of the documents. Normally, this is "index", but if your "index"

document is a custom template, you can also set this to another filename.

> Name of your master document (without suffix) [index]:

Sphinx can also add configuration for epub output:

> Do you want to use the epub builder (y/n) [n]: y

Please indicate if you want to use one of the following Sphinx extensions:

> autodoc: automatically insert docstrings from modules (y/n) [n]: y

> doctest: automatically test code snippets in doctest blocks (y/n) [n]: y

> intersphinx: link between Sphinx documentation of different projects (y/n) [n]: y

> todo: write "todo" entries that can be shown or hidden on build (y/n) [n]: y

> coverage: checks for documentation coverage (y/n) [n]: y

> pngmath: include math, rendered as PNG images (y/n) [n]: y

> mathjax: include math, rendered in the browser by MathJax (y/n) [n]: y

Note: pngmath and mathjax cannot be enabled at the same time. pngmath has been deselected.

> ifconfig: conditional inclusion of content based on config values (y/n) [n]: y

> viewcode: include links to the source code of documented Python objects (y/n) [n]: y

A Makefile and a Windows command file can be generated for you so that you only have to run e.g. ``make html'` instead of invoking `sphinx-build` directly.

```
> Create Makefile? (y/n) [y]: y
> Create Windows command file? (y/n) [y]: y
```

```
Creating file Sphinx/conf.py.
Creating file Sphinx/index.rst.
Creating file Sphinx/Makefile.
Creating file Sphinx/make.bat.
```

Finished: An initial directory structure has been created.

You should now populate your master file `Sphinx/index.rst` and create other documentation source files. Use the Makefile to build the docs, like so:

```
make builder
```

where "builder" is one of the supported builders, e.g. `html`, `latex` or `linkcheck`.

make 参数

```
$ make
Please use `make <target>' where <target> is one of
  html          to make standalone HTML files
  dirhtml       to make HTML files named index.html in directories
  singlehtml    to make a single large HTML file
  pickle        to make pickle files
  json          to make JSON files
  htmlhelp      to make HTML files and a HTML help project
  qthelp        to make HTML files and a qthelp project
  devhelp       to make HTML files and a Devhelp project
  epub          to make an epub
  latex         to make LaTeX files, you can set PAPER=a4 or
PAPER=letter
  latexpdf      to make LaTeX files and run them through pdflatex
  latexpdfja    to make LaTeX files and run them through
platex/dvipdfmx
  text          to make text files
```

| | |
|--------------------------------|---|
| man | to make manual pages |
| texinfo | to make Texinfo files |
| info | to make Texinfo files and run them through |
| makeinfo | |
| gettext | to make PO message catalogs |
| changes | to make an overview of all |
| changed/added/deprecated items | |
| xml | to make Docutils-native XML files |
| pseudoxml | to make pseudoxml-XML files for display purposes |
| linkcheck | to check all external links for integrity |
| doctest | to run all doctests embedded in the documentation |
| (if enabled) | |

第 28 章 pandoc - general markup converter

<http://johnmacfarlane.net/pandoc/>

1. Docbook to Markdown

```
pandoc -f docbook -t markdown -s howto.xml -o example.text
```

2. Markdown to HTML

```
pandoc -f markdown -t html5 -s example.md -o example.html
```

例 28.1. Makefile

```
PANDOC = pandoc
PANDOCOPTS = -f markdown -t html5
PREFIX=..
HTML := $(patsubst %.md,%.html,$(wildcard *.md))

all: $(HTML)

%.html: %.md
    $(PANDOC) $(PANDOCOPTS) -s $< -o $(PREFIX)/$@

clean:
    @rm -rf $(PREFIX)/*.html

rebuild : clean all
```

第 29 章 Hugo

<https://gohugo.io/>

第 30 章 写作团队的运作

前提条件： subversion 服务器一台,或者使用sf.net, github.com, code.google.com 等等提供的服务，团队人员需要懂得docbook以及配置docbook环境

1. Docbook 环境初始化

1.1. FreeBSD

```
# pkg_add -r vim
# pkg_add -r git
# pkg_add -r libxml2 libxslt
# pkg_add -r docbook-xsl
```

创建 book.xml

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE subject SYSTEM
"/usr/local/share/xml/docbook/5.0/dtd/docbook.dtd">
<book>
  <bookinfo>
    <title>An Example Book</title>

    <author>
      <firstname>Your first name</firstname>
      <surname>Your surname</surname>
      <affiliation>
        <address>
          <email>foo@example.com</email>
        </address>
      </affiliation>
    </author>

    <copyright>
      <year>2000</year>
      <holder>Copyright string here</holder>
    </copyright>

    <abstract>
      <para>If your book has an abstract then it should
go here.</para>
    </abstract>
  </bookinfo>
```

```
<preface>
  <title>Preface</title>

  <para>Your book may have a preface, in which case it
should be placed
    here.</para>
</preface>

<chapter>
  <title>My first chapter</title>

  <para>This is the first chapter in my book.</para>

  <section>
    <title>My first section</title>

    <para>This is the first section in my book.</para>
  </section>

</chapter>
</book>
```

生成文档

```
$ xsltproc /usr/local/share/xsl/docbook/xhtml/docbook.xsl
book.xml > book.html
```

1.2. Ubuntu/Debian

```
$ sudo apt-get install docbook-xsl
$ sudo apt-get install xsltproc xmlto
$ sudo apt-get install make
$ sudo apt-get install git
```

创建 book.xml

```

<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE subject SYSTEM
"/usr/share/xml/docbook/schema/dtd/4.5/docbookx.dtd">
<book>
  <bookinfo>
    <title>An Example Book</title>

    <author>
      <firstname>Your first name</firstname>
      <surname>Your surname</surname>
      <affiliation>
        <address>
          <email>foo@example.com</email>
        </address>
      </affiliation>
    </author>

    <copyright>
      <year>2000</year>
      <holder>Copyright string here</holder>
    </copyright>

    <abstract>
      <para>If your book has an abstract then it should
go here.</para>
    </abstract>
  </bookinfo>

  <preface>
    <title>Preface</title>

    <para>Your book may have a preface, in which case it
should be placed
      here.</para>
  </preface>

  <chapter>
    <title>My first chapter</title>

    <para>This is the first chapter in my book.</para>

    <section>
      <title>My first section</title>

```

```
        <para>This is the first section in my book.</para>
    </section>

</chapter>
</book>
```

生成文档

```
$ xsltproc /usr/share/xml/docbook/stylesheet/docbook-
xsl/xhtml/docbook.xsl book.xml > book.html
```

2. Subversion 版本控制

1. subversion 初始化

1. trunk

2. branches

3. releases

4. tags

```
svn co svn://127.0.0.1/document
cd project
mkdir trunk
mkdir tags
mkdir branches
mkdir releases
svn ci -m "Initialized empty subversion repository in
your_project"
```

2. 创建docbook文档，安排章节

将章节拆分成独立文件，并在主文档头部声明

```
<!ENTITY chapter.system SYSTEM
"chapter.system.xml">
  <!ENTITY chapter.system.harddisk SYSTEM
"chapter.system.harddisk.xml">
    <!ENTITY chapter.network SYSTEM
"chapter.network.xml">
```

完成后导入subversion的trunk中

3. 创建版本分支

```
$ svn copy svn://netkiller.8800.org/document/trunk  
svn://netkiller.8800.org/document/branches/system  
$ svn copy svn://netkiller.8800.org/document/trunk  
svn://netkiller.8800.org/document/branches/network
```

4. 开始写作

我们假设jam负责system章节

1. checkout

```
$ svn checkout  
svn://netkiller.8800.org/document/branches/system
```

2. 编辑文件

```
vim chapter.system.xml
```

3. 校验XML

```
$ export  
DSSSL=/usr/share/xml/docbook/stylesheet/nwalsh/xhtml/ch  
unk.xsl  
$ xsltproc --stringparam html.stylesheet docbook.css  
${DSSSL} book.xml
```

4. 提交文件

```
$ svn ci -m "I have finished this chapter."
```

其他编辑人员操作类似checkout自己branche上的network章节等等

5. tags运作

当jam完成了指派的任务的第一个阶段后，可以创建一个tags

```
svn copy svn://netkiller.8800.org/document/branches/system
svn://netkiller.8800.org/document/tags/system_phase_I
```

tags 一旦建立，以后不会在更改

然后jam可以在/document/branches/system继续写作

6. 合并tags到主干

当tags完成后主编将其合并到trunk

```
svn merge
svn://netkiller.8800.org/document/tags/system_phase_I
```

然后发行unstable版本，你也可以每天产生一个快照。等待用户反馈。

反馈结果由负责人在/document/branches/system上修改，等待下一次发布在下一个阶段。

7. 发行文档

当一切OK时,我就可以把trunk 复制到 releases 中，随你怎命名。

```
$ svn copy svn://netkiller.8800.org/document/trunk
svn://netkiller.8800.org/document/release/document_v1.0
```

这个版本/document/release/document_v1.0就可以提供给读者了。

3. GIT

配置GIT环境

```
git config --global user.name "Neo Chan"  
git config --global user.email netkiller@msn.com
```

克隆仓库

```
git clone https://github.com/freebook/PHP.git
```

...

编辑文件

...

提交文件

```
git add *  
git commit -a
```

推送文件

```
git push origin master
```

第 31 章 AsciiDoctor - A fast text processor & publishing toolchain for converting AsciiDoc to HTML5, DocBook & more.

<http://asciidoctor.org/>

1. 安装环境

```
brew install asciidoctor
```

第 32 章 Calibre

1. ebook-convert

<https://manual.calibre-ebook.com/generated/en/ebook-convert.html>

```
PATH=$PATH:/Applications/calibre.app/Contents/MacOS  
ebook-convert netkiller.epub netkiller.mobi
```
